EXECUTIVE SUMMARY

The City of Phoenix is currently in the process of developing a Comprehensive Roadway Safety Action Plan, which will further shape the City's planning efforts in roadway safety. This project involves a review of current safety trends, existing programs and processes, and public/stakeholder involvement to create a vision and plan for the future. This memorandum is intended to provide a preliminary overview of historical crash trends within the City of Phoenix within the past five years. In later stages of this project, a dynamic crash dashboard will be developed to provide enhanced abilities in data analytics and reporting.

In the initial stages of this project, crash queries were obtained through the Maricopa Association of Governments (MAG) software tool for crash analysis, the Regional Transportation Safety Information Management System (RTSIMS). This report uses existing tools to conduct a safety analysis of the past five years, and compares trends to regional and statewide data. The following key findings are based on a review of RTSIMS crash data from 2015 to 2019:

- An annual average 30,376 crashes per year were reported during the five year study period. This equates to 83 crashes per day.
- Crashes on arterial and local roadways in the City of Phoenix increased by a rate of about 4.4% per year. This trend suggests that the crash frequency increased at a higher rate than the City's population, which in the same period grew 1.5% per year, on average.
- Most crashes result in no injury (70%), approximately one-quarter result in possible or minor injury (27%), 2.6% result in serious injury, and 0.6% result in fatal injury. This equates to two serious injury crashes occurring each day, and one fatal crash occurring every other day.
- The percentage of fatal and serious injury crashes has remained generally consistent over the past five years; however the percentage of no injury crashes has steadily increased over time.
- For all crash severities, rear end crashes were the most common collision manner, followed by leftturn crashes. These two crash types account for about half of all crashes.
- For fatal and serious injury crashes, the "Other" collision manner was reported most frequent (25%), which is commonly selected for crashes involving pedestrians and bicyclists. Other frequent crash types for fatal and serious injury crashes were left-turn (23%) and angle (21%).
- Crashes involving unrestrained drivers (i.e, lack of seatbelt or helmet use) have reduced in frequency.
- Due to lack of protection on impact, pedestrians and bicyclists (vulnerable users) are more frequently seriously injured when involved in motor vehicle crashes. In the City of Phoenix, crashes involving bicyclists and pedestrians represent nearly half (48%) of all fatal crashes.
- A greater share of pedestrian crashes is occurring in Phoenix compared to other agencies within the MAG Region. Phoenix represents 36% of Maricopa County's population and about 43% of the County's local and arterial road crashes; however, 63% of County crashes involving pedestrians occurred on City of Phoenix's local and arterial roads.
- Bicyclist crashes are occurring at a greater rate in Phoenix than in other agencies within the MAG Region. About 43% of all crashes involving bicyclists in Maricopa County occurred on City of Phoenix's local and arterial roads.
- For all crash severities, the majority of crashes occur during daylight hours (71%), with the remaining 29% of crashes occurring during dawn, dusk, or dark conditions.
- A correlation exists between injury severity and lighting condition; fatal and serious injury crashes occurred more frequently during dawn, dusk, and dark conditions (45%) compared to daylight conditions (55%).

MAG RTSIMS tool provided the ability to retrieve data quickly for numerous Citywide statistics. During the analysis process, several discrepancies were identified when comparing to past Phoenix data, which is common when comparing different datasets. The City of Phoenix conducts a robust data scrubbing process each year, which confirms crashes exist within the City of Phoenix boundaries, omits freeway crashes, and reviews characteristics of crashes in detail to correct the manner of collision if originally mis-coded. The RTSIMS crash data is not scrubbed, and comes directly from ADOT ACIS. These differences, along with variations in the querying process, are acknowledged as part of this report. This data contained in this report is intended to provide preliminary information; later stages of this project will modernize the existing City of Phoenix crash analysis process to improve and enhance data analytics and visualization.

INTRODUCTION

The City of Phoenix is currently in the process of developing a Comprehensive Roadway Safety Action Plan, which will further shape the City's planning efforts in roadway safety. This project involves a review of current safety trends, existing programs and processes, and public/stakeholder involvement to create a vision and plan for the future. This memorandum is intended to provide a preliminary overview of historical crash trends within the City of Phoenix within the past five years. Through the development of the project, a dynamic crash dashboard will be developed to provide enhanced abilities in data analytics and reporting. In the initial stages of the project, crash queries were obtained through the Maricopa Association of Governments (MAG) software tool for crash analysis, the Regional Transportation Safety Information Management System (RTSIMS).

The City of Phoenix prepares comprehensive collision summary reports each year, documenting the past year of motor vehicle, pedestrian, and bicycle-related crashes. This report uses existing tools (RTSIMS) to conduct a supplementary safety analysis of the past five years, and compare trends to regional and statewide data.

Crash data within the City of Phoenix was obtained for the past five years through the RTSIMS tool, from January 1, 2015, to December 31, 2019. At the time of the analysis, 2020 crash data was not available. The RTSIMS platform compiles historical crash data from the Arizona Crash Information System (ACIS) crash database maintained by the Arizona Department of Transportation (ADOT). The RTSIMS data excludes freeways, highways, and ramps; only arterial, collector, and local roadways are included. RTSIMS refers to this group as "Arterial and Local Roads". This naming refers to roadway classification and does not imply roadway ownership. The results of traffic safety data queries may differ slightly based on data source, filtering assumptions, modifications to raw data, and/or query techniques. The RTSIMS safety review is intended to identify trends and inform decisions to support roadway safety.

Due to the limited sample size of fatal crashes, fatal and serious injury crashes were combined to analyze trends in critical crashes. Unlike less severe crashes, the most common collision manner for fatal and serious injury crashes is "Other", which primarily represents bicyclist and pedestrian crashes, followed by left-turn and angle crashes. It was also observed that KA crashes are overrepresented in non-daylight conditions.

According to the US Census Bureau Annual Population Estimates (**Figure 1**), the City of Phoenix's population has grown about 6% during the five years under study, from 2015 to 2019. In 2020, the City of Phoenix's residents represented 23% of Arizona's population and 36% of Maricopa County's Population.

GENERAL TRENDS

Since 2015, the total number of crashes within the City of Phoenix has been steadily increasing, with a total of 31,827 crashes occurring in 2019 on the City's local and arterial roadway network. **Figure 2** shows the number of crashes by injury severity for each year in the analysis period. The percentage of fatal crashes has stayed relatively constant, ranging from 0.5% to 0.7% of all crashes. The percentage of serious injury crashes varied between 2.1% and 3.2% of fatal crashes. The combined minor injury and possible injury ranged has steadily decreased over the past five years, from 30.7% (2015) to 23.8% (2019). The share of no injury crashes has increased over the past five years, from 66.0% (2015) to 73.6% (2019). This data suggests a slight downward trend in the severity of crashes.

Figure 3 shows the number of fatal and serious injury crashes from 2015 to 2019, which combined are trending towards fewer crashes since 2016.

ROADS

Figure 2: Total Number of Crashes per Year and Injury Severity (Local and Arterial Roads)

Serious Injury Fatal

Roado

Crash data from 2020 was not available through RTSIMS at the time of this report. Based on a preliminary review of 2020 crash data, total number of crashes decreased by about 20% from 2019 crashes, which is presumed to be related to lower vehicle miles travelled as a result of the COVID-19 pandemic. The share of fatal and incapacitating injury crashes remained generally consistent with the previous five years; however, the share of no injury crashes followed the same positive trend (increasing from 73.6% in 2019 to 74.2% in 2020). Preliminary 2021 crash data, obtained through the Phoenix Police Department Vehicle Crimes Unit (VCU), indicate that there were 114 fatal crashes during the first six months of 2021.

Table 1 shows the distribution of crashes on City of Phoenix local and arterial roads by collision manner for the past five years. The most frequently-reported crash types were rear-end crashes (29% of all reported crashes) followed by left-turn crashes (23% of all crashes). Together, rear-end and left-turn crashes represent about half of all crashes.

	2015	2016	2017	2018	2019	Total	%
Rear-end (Front-To-Rear)	8,319	9,144	9,002	8,811	8,870	44,146	29.1%
Left Turn	5,864	6,658	7,070	7,120	7,678	34,390	22.6%
Angle (Front to Side) (Other Than Left Turn)	5,246	5,434	5,448	5,434	5,404	26,966	17.8%
Sideswipe, Same Direction	3,259	4,176	4,149	4,374	4,602	20,560	13.5%
Single Vehicle	2,045	2,223	2,192	2,224	2,191	10,875	7.2%
Other (Includes Pedestrians and Bicyclists)	1,002	1,309	1,324	1,116	1,046	5,797	3.8%
Head-on (Front-To-Front) (Other Than Left Turn)	488	666	673	696	743	3,266	2.2%
Sideswipe, Opposite Direction	349	556	616	625	645	2,791	1.8%
Rear-To-Rear	163	430	277	230	195	1,295	<1%
Rear-To-Side	161	183	193	193	208	938	< 1%
Unknown	110	133	162	203	245	853	< 1%
Total	27,006	30,912	31,106	31,026	31,827	151,877	

Table 1: Number of Crashes per Year and Collision Manner

Note: The City of Phoenix uses a data scrubbing process to improve consistency of coding for collision manner. For example, the City of Phoenix defines left-turn crashes as involving vehicles originally traveling in the opposing (parallel) direction. If a crash involves a left-turning movement, but the vehicles originate in perpendicular paths, the collision is defined as an angle crash. The results of Table 1 were summarized using RTSIMS data, which does not involve the City of Phoenix scrubbing process. Therefore, these results vary from City of Phoenix scrubbed data, which identifies that the leading manner of collision is rear-end crashes, followed by angle crashes, then left-turn crashes.

Table 2 shows the number of pedestrian and bicyclist crashes per year, as well as the injury severity.Pedestrian crashes have been slowly increasing over the past five years, while bicyclist crashes have beendecreasing. An initial review of 2020 data indicates consistency with these trends.

Over the five-year period, pedestrians were involved in an average of 86 fatal crashes per year, and bicyclists were involved in an average of 8 fatal crashes per year. Combined, crashes involving pedestrians and bicyclists represent nearly half (48.6%) of all fatal crashes. Preliminary 2021 crash data, obtained through the Phoenix Police Department VCU, indicate that there a total of 114 fatal crashes reported in the first six months of 2021, 52 (45.6%) of which involved pedestrians, and 4 (3.5%) of which involved bicyclists.

	2015	2016	2017	2018	2019	Total
Bicyclists	438	485	470	384	298	2,075
No Injury	35	35	17	14	0	101
Possible Injury	157	151	152	129	118	707
Minor injuries	185	219	235	186	147	972
Serious Injury	53	71	52	52	26	254
Fatal	8	9	14	3	7	41
Pedestrians	617	771	813	825	820	3,846
No Injury	30	24	9	9	0	72
Possible Injury	153	164	194	186	247	944
Minor injuries	247	306	319	332	347	1,551
Serious Injury	127	189	197	187	148	848
Fatal	60	88	94	111	78	431
All Crashes	27,006	30,912	31,106	31,026	31,827	151,877

Table 2: Number of Pedestrian and Bicyclists Crashes per Year and Collision Manner

CRASHES BY MONTH

Figure 4 and **Figure 5** show the frequency of crashes in the City of Phoenix (arterial and local roads) by month. The month-to-month trends are consistent between all crashes, serious injury crashes, and fatal crashes. March registered the highest number of crashes, including fatal and injury crashes. The month with the fewest reported crashes was July, which correlates with lower summer traffic volumes. Lower traffic volumes in June and July are often associated with school breaks, seasonal resident travel, lower pedestrian and bicyclist activity, and lower traffic volumes in general due to the high temperatures.

Figure 5: Number of Serious Injury and Fatal Crashes by Month (2015-2019)

CRASHES BY DAY OF WEEK

Figure 6 shows the distribution of crashes by weekday. Crashes occur most frequently on Fridays, while the fewest crashes occur on Sundays. Fatal crashes occur most often on Saturdays and Sundays, and occur less frequently on Mondays.

CRASHES BY TIME OF DAY

Figure 7 shows that the majority of crashes (71%) occurred under daylight conditions, with 29% of crashes occurring during dawn, dusk, or dark conditions.

Figure 8 shows how the crashes are distributed by lighting conditions over the course of the day. In addition to the AM peak around 7 to 8 AM, a large number of crashes occur during the PM peak from 3 to 6 PM.

Crashes involving dawn and dusk conditions were limited between 4 to 7 AM and 4 to 7 PM, respectively.

Figure 7: Share of Crashes by Light Condition, 2015-2019

Figure 8: Number of Crashes by Hour of the Day and Light Condition (2015-2019)

CRASHES BY LOCATION

To classify a crash's relation to the junction, crashes were separated by Junction Type as either an Intersection/Interchange crash or a Non-Intersection/Non-Interchange crash. **Figure 9** shows where the location type of crashes that occurred during the study period of 2015 to 2019.

Figure 9: Crash Location Relative to Junctions, by Year

Figure 10 shows the injury severity between the three location types. In general, crashes are slightly more severe at intersections and interchanges, compared to segment collisions, which correlates with the greater frequency and types of collisions/conflict points possible.

The collision manner of intersection and interchange crashes is shown in **Figure 11**. The three most common crash types at intersections are left-turns, rear-ends, and angle crashes, respectively.

To rank the intersections based on a holistic safety analysis, the MAG's network screening methodology was used to classify the City of Phoenix's intersections per their safety score. The scoring methodology combines three safety attributes on the intersection, including crash frequency, crash severity, and crash type. The three factors are weighted together for the final Intersection Safety Score, with crash severity as 50%, crash frequency as 25%, and crash type as 50% of the weighting. **Table 3** and **Figure 12** show the Top 20 intersections with the highest Intersection Safety Score within the City of Phoenix.

The intersections with the greatest crash risk exist at 1) 75th Avenue and Indian School Road, 2) 67th Avenue and Indian School Road, and 3) 67th Avenue and McDowell Road. Formal Road Safety Assessments (RSA) have been conducted at 10 of the Top 20 high crash risk intersections.

Rank, City of Phoenix	Rank, MAG Region	RSA Conducted?	Location	# Crashes	Crash Frequency Score (CF)	Crash Severity Score (CS)	Crash Type Score (CT)	Final Score
1	1	2015*,2021*	75th Ave & Indian School Rd	251	1.06	1.36	1.29	1.26
2	2	2013,2015*, 2021*	67th Ave & Indian School Rd	273	1.15	1.32	1.18	1.24
3	3	2016	67th Ave & McDowell Rd	246	1.04	1.30	1.27	1.23

Table 3: High Crash Risk Intersections (Intersection Safety Score)

Note: *Location was studied as part of a corridor RSA.

Figure 12: High-Crash Intersections (Top 20 Intersection Safety Score)

BEHAVIOR CHARACTERISTICS

In the period of 2015 to 2019, alcohol and drug-impaired drivers were responsible for 7,487 crashes, which represents 5% of all crashes on local and arterial roads in the City of Phoenix. However, of all 4,962 fatal and serious injury crashes, 1,117 (22%) were associated with impaired drivers. **Figure 13** shows the distribution of crashes involving impaired drivers (alcohol, drugs) by the hour of the day. Unlike the total number of crashes that show two distinct peaks of crashes over the AM and PM traffic peaks (**Figure 8**), crashes involving impaired drivers are mostly concentrated during the late hours of the night (7 PM to 3 AM).

During the five years analyzed in this report, the total number of crashes involving unrestrained drivers show a steady decline. From 2015 to 2019, unrestrained driver crashes have reduced by approximately 20%. **Figure 14** shows the injury severity of such crashes over the years. On average, about 7% of unrestrained driver crashes are fatal crashes, which is a significantly larger share compared to all crashes.

Figure 15 shows the severity associated with speed-related crashes across the study period. While on average about 70% of speed-related crashes result in no injury, close to 2% of such crashes result in serious injury or fatality.

Note: Violation considered was "Speed too fast for conditions".

TRENDS BY PERSON TYPE

This sub-section of the report further explores crashes involving pedestrians, bicyclists, older drivers, and younger drivers. The analysis period is from 2015 to 2019. Pedestrian and bicyclists are considered to be vulnerable roadway users; as there is little to no protection in collisions with motor vehicles. Crashes involving pedestrians and bicyclists are more likely to result in critical injuries.

PEDESTRIANS

Figure 16 shows the injury severity of crashes involving pedestrians on the City of Phoenix's local and arterial roads from 2015 to 2019. While most (70%) motor-vehicle crashes result in no injury, that is not the case for crashes that involve pedestrians. Rather, 11% of crashes involving pedestrians were fatal and 22% resulted in serious injuries. In the five studied years, the number of crashes involving pedestrians trended upward, with 2019 crashes representing a 33% increase from 2015.

Figure 16: Injury Severity for Crashes Involving Pedestrians, by Year

Figure 17 shows the collision manner for the crashes involving pedestrians. As most of the collision manner categories developed for the Arizona Crash Report form are oriented towards motor vehicles, the most common collision manner reported on pedestrian crashes was "Other", which is often selected by the responding police officer for crashes involving pedestrians or bicyclists.

Figure 18 and **Figure 19** show the distribution of pedestrian crashes by month and by hour, respectively. The months with the highest frequency of crashes involving pedestrians are November and December. The hours with the highest frequency of crashes involving pedestrians occur in the evening, from 6:00 pm to 9:00 pm.

Figure 18: Number of Crashes Involving Pedestrians, by Month

Figure 19: Number of Crashes Involving Pedestrians, by Hour

BICYCLISTS

Similar to pedestrian crashes, crashes involving bicyclists registered higher rates of fatalities and serious injuries, with virtually no crashes being reported as property damage only (**Figure 20**). During the past five years, the number of bicycle-related crashes have trended downward. From 2015 to 2019, the number of crashes involving bicyclists has reduced by 32%.

Figure 20: Injury Severity for Crashes Involving Bicyclists, by Year

Figure 21 shows the collision manner for crashes involving bicyclists. As it was observed for pedestrian crashes, the most common collision manner was "Other". However, for crashes involving bicyclists, a significant share of crashes was a result of angle crashes.

Figure 21: Injury Severity for Crashes Involving Bicyclists, by Collision Manner (2015-2019)

Figure 22 and **Figure 23** show the distribution of crashes involving bicyclists by month and by hour, respectively. The month with the highest number of crashes involving bicyclists was March. The highest number of crashes involving bicyclists correlates with vehicular morning and afternoon peak hours.

Figure 22: Number of Crashes Involving Bicyclists, by Month

Figure 23: Number of Crashes Involving Bicyclists, by Hour

OLDER DRIVERS (Age 65 and Older)

Older drivers (age 65 and older) were involved in 20,425 (13%) of all incidents reported in the City of Phoenix's local and arterial roads from 2015 to 2019. **Figure 24** shows the injury severity of those crashes.

Figure 24: Injury Severity for Crashes Involving Older Drivers, 2015-2019

The most common collision manner of crashes involving older drivers were rear-end and left-turn crashes are shown in **Figure 25**. **Figure 26** shows the distribution of older driver crashes by month and **Figure 27** shows the distribution by hour of the day. The month with the highest number of crashes involving older drivers was March. The greatest frequency of older driver crashes occurs in the afternoon, from 2pm to 4pm.

Figure 25: Collision Manner for Crashes Involving Older Drivers, by Year

Figure 26: Number of Crashes Involving Older Drivers, by Month

Figure 27: Number of Crashes Involving Older Drivers, by Hour

YOUNGER DRIVERS (Age 24 and Younger)

Younger drivers (age 24 and below) were involved in 62,512 (41%) of all incidents reported in the City of Phoenix's local and arterial roads from 2015-2019. **Figure 28** shows the injury severity of those crashes.

Figure 29: Collision Manner for Crashes Involving Younger Drivers, by Year

The most common collision manners of crashes involving younger drivers were rear-end and left-turn crashes (Figure 29). Figure 30 shows the distribution of younger driver crashes by month and Figure 31 shows the distribution by hour of the day. The month with the highest number of crashes involving younger drivers was March. An increase in crash frequency was associated with the AM and PM peaks of vehicular travel.

Figure 30: Number of Crashes Involving Younger Drivers, by Month

TRENDS OF FATAL AND SERIOUS INJURY CRASHES

This analysis uses the KABCO scale of crash severity, where "K" denotes a fatal crash, "A" is a serious injury crash, "B" is a minor injury crash, "C" is a possible injury crash, and "O" is a property damage-only crash. This subsection of the report further details crashes that resulted in at least one serious injury or fatality, and this sub-set of crashes are referred to as "KA" or "KSI" Crashes. A review of critical crashes can identify key trends for further investigation. Compared to reviewing fatal crashes only, reviewing the combination of fatal and serious injury crashes provides a greater sample size and reduces the volatility between years.

KA CRASHES BY COLLISION MANNER

Figure 32 compares the collision manner of KA crashes with crashes that resulted in no injury, possible injury, or minor injuries (BCO crashes). The most common collision manner of BCO crashes is rear-end crashes, while the most common collision manner for KA crashes is "Other". It is important here to note that the "Other" category is often used to describe the collision manner of crashes involving pedestrians (Figure 17) and crashes involving bicyclists (Figure 21). The second and third most common collision manners for KA crashes are left-turn and angle crashes, respectively.

No injury, possible injury, and non-incapacitating injury crashes (N=146,915) KA crashes (N=4,962)

KA CRASHES BY MONTH

Figure 33 shows the distribution of KA crashes by month in the period of 2015 to 2019. Consistent with overall crash trends, the month with the highest number of fatal crashes was March and the lowest number of fatal crashes was observed in July.

Figure 33: Number of Fatal and Serious Injury Crashes, by Month, 2015-2019

KA CRASHES BY DAY OF WEEK

Figure 34 shows the distribution of fatal and serious injury crashes by day of the week. The day with the highest frequency of serious crashes was Friday, and Sunday was the day with the lowest frequency of KA crashes.

KA CRASHES BY TIME OF DAY

When analyzing all crashes in the City of Phoenix's local and arterial roads together, only 26% of them occur in dark conditions (**Figure 7**). However, 40% of KA crashes were reported to have occurred in dark conditions.

Figure 35 shows that KA crashes are overrepresented in non-daylight conditions.

Figure 35: Share of Fatal and Serious Injuries Crashes by Light Condition, 2015-2019

Figure 36: Number of Fatal and Serious Injuries Crashes, by Hour and Lighting Condition

KA CRASHES BY LOCATION

The same criteria to determine the relationship to the closest junction applied to all crashes was applied to KA crashes. **Figure 37** shows the crash location by year; about 50% of KA crashes were related to intersections or interchanges.

Figure 37: Number of Fatal and Serious Injuries Crashes, by Relation to the Intersection

When comparing the collision manner on intersection-related serious crashes (**Figure 38**) and all crashes (**Figure 11**), it can be seen that while rear-end crashes are the second most common intersection-related crashes, they represent less than 10% of serious crashes. The most common collision manner of intersection-related KA crashes were left-turn and angle crashes.

Figure 38: Number of Intersection/Interchange-Related Fatal and Serious Injuries Crashes, by Collision Manner

KA CRASHES BY BEHAVIOR

Figure 39 depicts the frequency of unrestrained driving and speed violation in serious injury and fatal injury crashes. Crashes involving unrestrained drivers represent 16% of KA crashes, and speed-related crashes represent 29% of KA crashes.

Figure 39: Frequency of Unrestrained Driving and Speed Violation in KA Crashes

COMPARISON TO STATEWIDE AND REGIONAL SAFETY TRENDS

Nationwide summaries of all crashes are available from the National Highway Traffic Safety Administration (NHTSA) Annual Report Tables. NHTSA reports on a yearly basis crash summaries by diverse aspects, such as injury severity, first harmful event, and collision manner.

The Arizona Strategic Traffic Safety Plan (ADOT STSP), published in October 2019, summarizes crash data from the ACIS database from 2009 to 2018. The crash statistics in the ADOT STSP are primarily reported at the person-level, which varies from the RTSIMS reporting, which is primarily at the crash-level. Furthermore, the ADOT STSP does not make any distinction between local roads and freeways while RTSIMS reports (for the purpose of this summary) focus on local and arterial roads only. For the purposes of this comparison, statewide data at the crash-level was retrieved from the ACIS database.

From 2015 to 2018, 43% of the MAG Region's local and arterial road collisions were registered in the City of Phoenix (**Figure 40**). In terms of population, City of Phoenix residents represent 36% of Maricopa County's population. **Figure 41** compares the injury severity of collisions reported in the state of Arizona, MAG Region local and arterial roads, and City of Phoenix local and arterial roads. The results indicate that the fatality rate (at the crash level) is rather similar among the geographies; from 2015 to 2018, 0.6% of all crashes reported on local and arterial roads were fatal crashes, both in the City of Phoenix and in the MAG Region, at the state level, about 0.7% of all reported crashes were fatal.

Figure 40: Total Crashes Comparison of State of Arizona, MAG Region, and City of Phoenix

In the same period, fatal crashes in the City of Phoenix corresponded to 46.6% of the MAG Region's fatal crashes. **Figure 42** shows a similar comparison for fatal crashes registered on the two areas, in addition to the total crashes in the state of Arizona. **Figure 43** shows the number of fatalities (person-level) registered per year in the state of Arizona and the City of Phoenix. During the five years under study, fatalities on the City of Phoenix's local and arterial roads represented 21% of all Arizona's traffic-related fatalities. This percentage is slightly lower than the share of Arizona residents living in Phoenix in the same period (23%).

*Note: MAG data was sourced from the MAG Strategic Transportation Safety Plan, which analyzed data from 2009 to 2018. Data from 2019 was not available for comparison.

From 2018 to 2019, the number of fatalities in Arizona decreased by 3%. Fatalities in the City of Phoenix (local and arterial roads) decreased by 26% from 2018 to 2019 (**Figure 43**); however, the year-to-year fluctuation in this data does not indicate a clear trend. National statistics on 2019 fatalities and percent change trends from 2018 are shown in **Figure 44**.

Source: FARS 2018 Final File, 2019 ARF Note: Puerto Rico is not included in the USA total.

> Figure 44: 2019 Fatalities and Percent Changes From 2018, by State (Person-Level). (Source: FARS Data, NHTSA Graph)

PEDESTRIANS

A large share of traffic fatalities involve pedestrians. **Figure 45** shows that the State of Arizona was above the national average, with pedestrians accounting for approximately 22% of 2019 fatalities. In the City of Phoenix, the share of fatalities that is represented by pedestrians grew from 37% in 2015 to 44% in 2019 (**Figure 46**).

Source: FARS 2019 ARF

Figure 46: Share of Total Fatalities Who Were Pedestrians, Comparison across Geographies

Although the MAG STSP data does not exclude freeway crashes, an analysis of the data found that 98% of total pedestrian crashes in the 10-year studied period (2009-2018) occurred off-freeway, on the local and arterial roadway network. The analysis also found that the same percentage was true for bicycle-related crashes. Therefore; the MAG STSP and RTSIMS datasets are reasonably similar for comparison purposes. As shown in **Figure 47**, The percentage of pedestrian-related crashes was found to be 1.1% in all United States, 1.1% in the State of Arizona, 1.7% in the MAG region, and 2.5% in the City of Phoenix.

Phoenix represents 36% of the County's population and about 43% of local and arterial road crashes; however, 63% of Maricopa County's pedestrian-related crashes occurred in the City of Phoenix's local and arterial roads.

*Note: MAG data was sourced from the MAG Strategic Transportation Safety Plan, which analyzed data from 2009 to 2018. Data from 2019 was not available for comparison.

In terms of injury severity, the distribution of pedestrian-related crashes is very similar in the MAG Region and the City of Phoenix (**Figure 48**). The majority of crashes (63%) of both datasets result in possible or minor injury, while nearly one-quarter (22-23%) result in serious injury, and about 12% result in fatal injury. Only a very small portion of pedestrian-related crashes result in no injuries (2-3%).

Figure 48: Severity of Pedestrian Crashes, Comparison across Geographies (2015-2018)

BICYCLISTS

As shown in **Figure 49**, the percentage of crashes involving bicyclists was similar between the two areas, with an average of 1.5% of total crashes in the MAG Region and 1.5% in the City of Phoenix. The injury severity distribution of bicyclist-related crashes is also similar between the two areas, as shown in **Figure** 50. The majority of crashes (78-79%) of both datasets result in possible or minor injury, 13% result in serious injury, and 2% result in fatal injury. About 6-7% of bicyclist-related crashes resulted in no injuries.

*Note: MAG data was sourced from the MAG Strategic Transportation Safety Plan, which analyzed data from 2009 to 2018. Data from 2019 was not available for comparison.

Figure 49: Bicycle Crashes per Year, Comparison across Geographies

Figure 50: Severity of Bicycle Crashes, Comparison across Geographies (2015-2018)

OLDER DRIVERS (65 and older)

Other vulnerable user groups were also analyzed, including older drivers and younger drivers. **Figure 51** compares the number of crashes involving older drivers on all roads of the MAG Region and City of Phoenix's local and arterial roads. Approximately 28% of the older driver crashes in the MAG Region were registered on City of Phoenix's local and arterial roads.

^{*}Note: 2019 data was not available for the MAG Region per its Strategic Transportation Safety Plan. Figure 51: Older Driver Crashes per Year, MAG Region, and City of Phoenix

Figure 52 shows a breakdown by injury severity for crashes on local and arterial roads involving older drivers in the period of 2015-2018. Compared to crashes involving all age groups, the percentage of fatal and serious injury crashes remained the same, with a slight shift from no injury to possible and minor injury crashes. The trends of older drivers are quite similar between the MAG Region and City of Phoenix.

Figure 52: Severity of Older Driver Crashes, MAG Region and Phoenix (2015-2018)

YOUNGER DRIVERS (24 and below)

Figure 53 compares the number of crashes involving younger drivers on all roads of the MAG Region and City of Phoenix's local and arterial roads. Younger driver crashes on the City of Phoenix's local and arterial roads represented about 31% of crashes involving younger drivers in the MAG Region.

*Note: MAG data was sourced from the MAG Strategic Transportation Safety Plan, which analyzed data from 2009 to 2018. Data from 2019 was not available for comparison.

Figure 53: Younger Driver Crashes per Year, MAG Region, and City of Phoenix

Figure 54 shows that the severity of crashes on local and arterial roads involving younger drivers was similar in both geographies. In addition, the younger driver crashes are generally consistent with the overall crash summaries of each area for all age groups.

Figure 54: Severity of Younger Driver Crashes, MAG Region and Phoenix (2015-2018)

CONCLUSION

Crash queries were obtained through the Maricopa Association of Governments (MAG) software tool for crash analysis, the Regional Transportation Safety Information Management System (RTSIMS). This report used existing tools to conduct a safety analysis of the past five years, and compared trends to regional and statewide data. The following key findings are based on a review of RTSIMS crash data from 2015 to 2019:

- An annual average 30,376 crashes per year were reported during the five year study period. This equates to 83 crashes per day.
- Crashes on arterial and local roadways in the City of Phoenix increased by a rate of about 4.4% per year. This trend suggests that the crash frequency increased at a higher rate than the City's population, which in the same period grew 1.5% per year, on average.
- Most crashes result in no injury (70%), approximately one-quarter result in possible or minor injury (27%), 2.6% result in serious injury, and 0.6% result in fatal injury. This equates to two serious injury crashes occurring each day, and one fatal crash occurring every other day.
- The percentage of fatal and serious injury crashes has remained generally consistent over the past five years; however the percentage of no injury crashes has steadily increased over time.
- Rear end crashes were the most common collision manner, followed by left-turn crashes. These two crash types account for about half of all crashes.
- For fatal and serious injury crashes, the "Other" collision manner was reported most frequent (25%), which is commonly selected for crashes involving pedestrians and bicyclists. Other frequent crash types for fatal and serious injury crashes were left-turn (23%) and angle (21%).
- Crashes involving unrestrained drivers (i.e, lack of seatbelt, helmet use) have reduced in frequency.
- Due to lack of protection on impact, pedestrians and bicyclists (vulnerable users) are more frequently seriously injured when involved in motor vehicle crashes. In the City of Phoenix, crashes involving bicyclists and pedestrians represent nearly half (48%) of all fatal crashes.
- A greater share of pedestrian crashes is occurring in Phoenix compared to other agencies within the MAG Region. Phoenix represents 36% of Maricopa County's population and about 43% of the County's local and arterial road crashes; however, 63% of County crashes involving pedestrians occurred on City of Phoenix's local and arterial roads.
- Bicyclist crashes are occurring at a greater rate in Phoenix than in other agencies within the MAG Region. About 43% of all crashes involving bicyclists in Maricopa County occurred on City of Phoenix's local and arterial roads.
- For all crash severities, the majority of crashes occur during daylight hours (71%), with the remaining 29% of crashes occurring during dawn, dusk, or dark conditions.
- A correlation exists between injury severity and lighting condition; fatal and serious injury crashes occurred more frequently during dawn, dusk, and dark conditions (45%) compared to daylight conditions (55%).

The MAG RTSIMS tool provided the ability to retrieve data quickly for numerous Citywide statistics. During the analysis process, several discrepancies were identified when comparing to past Phoenix data, which is common when comparing different datasets. The City of Phoenix conducts a robust data scrubbing process each year, which confirms crashes exist within the City of Phoenix boundaries, omits freeway crashes, and reviews characteristics of crashes in detail to correct the manner of collision if originally mis-coded. The RTSIMS crash data is not scrubbed, and comes directly from ADOT ACIS. These differences, along with variations in the querying process, are acknowledged as part of this report. This data contained in this

report is intended to provide preliminary information; later stages of this project will modernize the existing City of Phoenix crash analysis process to improve and enhance data analytics and visualization.

APPENDIX A: RTSIMS QUERY OUTPUTS
